

How the Admin Dashboard Works

Tribal Scholar AI — a practical guide to the admin screens, navigation and review workflows

1 · Signing In

Start the app with `npm run dev`, then open `/login`. Sign in with a demo admin account; every role uses the password `demo1234`.

Role	Email	Typical abilities
Scrutiny Officer	scrutiny@demo.com	Review applications, verify documents, raise deficiencies
Selection Officer	selection@demo.com	Score candidates and shortlist for selection
Administrator	admin@demo.com	Full access including selection and approvals

The portal shows a Demo badge on every screen to make it clear this is a hackathon prototype.

2 · Layout and Navigation

The admin area opens with a left sidebar containing seven sections. On smaller screens the sidebar collapses into a horizontal scrolling pill bar.

- Summary of everything: stats, charts, recent applications and flags that need attention.
- All applications, with search, filters and the full review page.
- Uploaded documents and their AI/OCR verification results.
- Issues raised on applications and their resolution.
- Candidate scoring and the ranked merit list.
- Charts and key performance indicators.
- Complete, immutable history of actions.

3 · Dashboard

- **Quick actions** Shortcuts to the most common tasks.
- **Stats cards** A featured total plus application counts grouped by status.
- **KPI strip** Approval rate, average processing time and deficiency rate.
- **Applications received** An area chart of weekly submissions over the last six weeks.
- **Scheme split** A donut chart of the NFST vs NOS share.
- **Recent applications** The latest submissions with their current status.
- **Status distribution** A bar breakdown across every status.
- **Per-scheme cards** Pipeline, selected and deficient counts per scheme.
- **Needs attention** Applications flagged with open deficiencies.

4 · Applications and Review

Open Applications to see the searchable table. Filter by application number or applicant, scheme, and status, then click Review to open the detail view.

- **Header** Application number, applicant, scheme, current status, and the allowed next actions. Buttons appear only for transitions the signed-in role may perform.
- **Applicant information** Personal, category, tribal, income, education and bank details of the applicant.
- **Scheme-specific details** The fields collected by the NFST or NOS application form.
- **Verification results** AI/OCR outcome and confidence for each uploaded document.
- **Eligibility results** Automatic pass, fail or needs-review per eligibility rule.
- **Document review** The documents themselves, with per-document status.
- **Status history** A timeline of every status change with the actor and remarks.

Advancing an application opens a confirmation dialog that records who acted and stores a remark in the status history.

5 · The Application Pipeline

Statuses follow the workflow defined in `src/lib/workflow.ts`. The lifecycle is:

- SUBMITTED goes through UNDER DOCUMENT VERIFICATION, then UNDER ELIGIBILITY CHECK.
- ELIGIBLE moves to UNDER SCRUTINY; INELIGIBLE ends the process.
- UNDER SCRUTINY can raise a DEFICIENT (asks the applicant to correct) or is marked SCRUTINY COMPLETE.
- DEFICIENT returns to UNDER SCRUTINY once the applicant responds.
- SCRUTINY COMPLETE moves to UNDER SCREENING.
- UNDER SCREENING results in SELECTED or REJECTED.

- **SELECTED** is finally **APPROVED**, or can be **REJECTED**.

Applicants can withdraw their own applications while they are **DRAFT** or **SUBMITTED**.

6 · Documents

- Filter by status, document type, or search by document, application number or applicant.
- Each row shows the upload date, scheme, an OCR confidence bar and the verification status.
- Inspect opens a modal with the extracted data; a document can be marked **Verified** or **Rejected** from there.

7 · Deficiencies

- Four summary cards count **OPEN**, **RESPONDED**, **RESOLVED** and **REJECTED** records.
- New Deficiency lets you pick an application and document type and describe the issue.
- The review panel opens a record and lets you **Resolve** or **Reject** it with remarks.

8 · Selection and Merit List

- **Selection summary**Totals and a scheme breakdown of the candidate pool.
- **Scoring panel**Score each candidate against the scheme criteria; the total updates live.
- **Merit list**Candidates ranked by total score with checkboxes.
- **Bulk actions**Select several candidates and mark them **Selected** or **Rejected** in one step.

9 · Reports and Analytics

- **KPI cards**Total applications, approval rate, average processing time and deficiency rate.
- **Applications received**Weekly submissions over the last six weeks.
- **Scheme split**Share of applications per scheme.
- **Top states**Applications by applicant state.
- **Status distribution**Full breakdown across every application status.

10 · Audit Log

- A filterable table of every action, including logins, status changes, deficiencies and document decisions.
- Each entry shows the actor, role, timestamp and details, so a demo can be reconstructed exactly.

11 · Practical Tips

- Everything runs on demo data, so changes last until the page session resets.
- The Demo badge marks prototype screens across the portal.
- The actions you see depend on the account you signed in with, because transitions are role-gated.
- Use the audit log during a demo to retrace exactly what happened.

Built for the MoTA hackathon prototype. Live APIs will replace the mock layer at integration time (see docs/[api.md](#)).
