

What We Changed and Improved

Tribal Scholar AI — AI-enabled Scholarship and Fellowship Management System · MoTA Hackathon Prototype

Overview

This document summarises everything delivered since the project scaffold. The admin portal started as a set of empty placeholder pages and now covers the full scholarship lifecycle: a data-rich dashboard, application review with AI/OCR document checks, deficiency management, selection scoring with merit lists, reports and analytics, and a complete audit trail. The applicant portal and marketing landing page were built out with the same polish.

All screens run against an isolated mock-data layer, so the UI is fully interactive today and ready to be wired to live API endpoints (contracts are documented in docs/api.md).

1 · Foundation

- **Modern stack**Next.js 16 (App Router), TypeScript, Tailwind CSS v4, ESLint 9, Prisma ORM with PostgreSQL; shared types and utilities under src/types and src/lib.
- **Documentation**Architecture, database schema, API contracts, workflow rulebook, scheme rulebook, AI/OCR contract, demo script, GitHub workflow, issue list and team status tracker (docs/).
- **Database and seed**Full Prisma schema with an initial migration and rich seed data: two schemes (NFST and NOS), eligibility rules, required documents, form fields, demo users and sample applications.

2 · Admin Portal

The admin area was upgraded from empty stubs into an end-to-end operational panel.

Feature	What was delivered	Commits
Admin Dashboard	KPI stat cards, quick actions, recent applications, application trend chart, scheme-split donut, status distribution, per-scheme pipeline cards and a needs-attention panel.	98100c5, 3f06869
Application management	Searchable and filterable applications table; rich review page with applicant details, scheme-specific fields, AI/OCR results, eligibility pass/fail and a status timeline.	55630d2

Document verification	Document queue with OCR confidence bars, status/type filters and an inspect modal to mark documents verified or rejected.	55630d2, c58d580
Deficiency management	Create deficiencies against any application, live open/responded/resolved/rejected counters, and a review panel to resolve or reject with remarks.	7e909a8
Selection and merit list	Scheme-wise criteria scoring with live totals, a ranked merit list and bulk select/reject actions.	8db5793
Reports and analytics	KPI cards, weekly application trend, scheme split, top applicant states and full status distribution charts.	c58d580
Audit log	Immutable, filterable trail of every action with the actor, timestamp and details.	c58d580

3 · Applicant Portal

- **Application tracking** Brand-new applications list and detail pages with an animated status stepper so applicants can follow their application end to end.
- **Supporting pages** Dashboard, scheme browsing, profile, documents and notifications views for the applicant.
- **Reusable components** ApplicationCard and StatusStepper extracted as shared building blocks for consistent rendering.

4 · Landing Page and Design System

- **Landing page** Rebuilt landing page with an animated preloader, hero effects, a live preview card, rotating scheme words, count-up statistics and scroll reveals.
- **Header and footer** Portal-aware header and a redesigned footer with a live workflow pipeline, CTA band, team socials and a ghost wordmark.
- **Charts without libraries** All charts are pure CSS/SVG (area, donut, bar and status grid) with no chart dependency, keeping the bundle small.
- **Responsive navigation** Sticky desktop sidebar plus a horizontal pill navigation on mobile with active-state styling.
- **Consistency** Shared components (Logo, NavIcon, PageHeader, ResultBadge, StatsCards, KpiStrip, QuickActions, NeedsAttention) and helpers (formatStatus, getStatusColor, date formatting).
- **Accessibility and cleanup** Modal focus and close handling for the deficiency and status dialogs, aria labels, hover states and removal of the global dark-mode override.

5 · Engineering Quality

- **Centralised workflow** src/lib/workflow.ts encodes the allowed status transitions so the review and selection screens stay in sync with the documented process.
- **Isolated mock layer** Analytics, audit, documents, applications, selection and deficiency data sit behind typed mock modules that can be replaced with API calls.
- **Type safety** The project passes tsc --noEmit, next build and ESLint; components are typed with shared enums from src/types.

- **Stats layout** The dashboard stats were reworked with a featured total card and a per-status grid for an at-a-glance overview.

6 · What Is Next

- Wire authentication end to end (register, login, roles).
- Connect applicant submission and document upload APIs.
- Live AI/OCR verification and the eligibility engine.
- Applicant response flow for deficiencies.
- Server-side data feeding for reports and charts.

All content is accurate as of the latest commit on feature/admin (3f06869). This is a hackathon prototype running on demo data, not a production system.
